1. With sufficient ambient light, the light will not be switched on even with the motion sensor activated.
2. With insufficient ambient light, the sensor will switch on the light when motion is detected.
3. After elapse of hold time, the sensor will dim the light if no new motion is detected.
4. After elapse of stand by period, the sensor switches off the light if no motion is detected.

DAYLIGHT PRIORITY (STAND BY PERIOD SET TO "+ ∞")

1. Lamp turns on at 10 % at night.
2. When motion is detected, lamp automatically lights up to 100 %.
3. After hold time, the lamp gradually dims to 10 % if no movement is detected.
4. Lamp turns off after dawn.

To avoid blocking the microwave emission, the microwave sensor can not be covered with metal materials, be sprayed with a coating of metal components, or have attached metal material or stickers etc.

The distance between the antenna and the glass (dielectric material) should be no less than 0.4ft when the sensor is within the glass lampshade. Otherwise, the microwave motion sensor will not penetrate the glass easily.

Avoid placing the sensor inside a metal chamber, this may cause a mis-trigger.

The sensor should not be placed in a small confined space. To avoid increasing the sensor detection range or abnormal operation, the sensor should be kept away from large areas of metal and glass reflectors (separation distance at least 3.3ft). Reduce the detection area setting.

To avoid affecting the microwave signal transmission, the microwave antenna should be higher than the surrounding metal surface.

Any vibration or movement may trigger the sensor. Ensure the sensor is far from any constant movement.

When multiple sensors are installed side-by-side in the same direction, the distance between each sensor should be at least 3.3ft (the warehouse sensors at least 9.8ft) to avoid mutual interference.
